Configuration Management Database (CMDB)

Use the ServiceNow® Configuration Management Database (CMDB) application to build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB as configuration items (CIs) which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Overview

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB Data Manager to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

Note: CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, Query Builder, or Duplicate CI Remediator or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CMDB Data Manager, baseline CMDB, and proposed changes.

CI Class Manager

View, create, or edit basic class definitions and class settings for identification and Reconciliation, and CMDB Health.

CMDB 360 / Multisource CMDB

Track and manage how multiple sources populate the same CI attributes.

CMDB Data Manager

Perform bulk management of CI life cycle operations such as deletion, archival, and attestation.

Duplicate CIs

Remediate single or bulk de-duplication tasks.

CIs attestation

Verify the existence of actual IT infrastructure and applications, systematically and in bulk.

Data Certification

Validate all your data in the CMDB on a regular schedule or on-demand, in CMDB and non-CMDB tables.

CMDB Query

Builder Build complex infrastructure and service queries.

Unified Map

View a hierarchical map of CIs and the relationships between them.

CMDB Health

Monitor and maintain CMDB health: duplicate CIs, required CI fields, and audits.
